Professional Summary

Full-stack developer with hands-on software development training at Zone01 Kisumu and a strong backend focus. Experienced in Go, PostgreSQL, REST APIs, Git, and Linux, with growing frontend experience in JavaScript, React, Vite, HTML, and CSS and experience in collaborative engineering.

Technical skills

Languages: Go(Golang), JavaScript, Python, SQL

Frameworks: Fiber, Svelte, Gin, FastAPI

Tools: Git, GitHub, Linux/WSL, Docker, Versel, PostgreSQL, MySQL, Vite

Projects

Pamoja-Build - Go, PostgreSQL, Docker, JavaScript, Lightning Network

- Collaborated in a team of six to develop a community development and crowd funding platform that lets communities raise money in Bitcoin and champion development through volunteer work and paid incentives.
- Built the frontend architecture for a Bitcoin Lightning payment platform. Implemented a custom SPA router, a resilient fetch-based HTTP client with retries and typed errors, reactive state stores, and a 21-component reusable UI system, plus end-to-end test infrastructure across three browser targets.

Progress-Bar - Full-stack learning & productivity tracker (React + Go)

- Built a multi-user SPA in React 19/Vite that unifies project milestones, learning goals, routines, and habit tracking behind progress visualizations (rings, heatmaps, streak calendars)
- Architected a Go (chi) backend with a pluggable course extractor that auto-imports course outlines from 7+ platforms (YouTube, Skool, Kajabi, Teachable) via yt-dlp/offcourse, falling back to manual entry
- Designed a normalized per-user data service layer (10+ entities) with auth, theming, and JSON import/export; shipped 25+ custom components incl. Eisenhower matrix and Kanban board

Mwangaza - Satellite-Driven Farm Advisory System - Go REST API on SQLite & Flutter

- Collaborated in a team of 5 to build Mwangaza, a satellite-driven farm advisory platform with a Go + SQLite REST API (SpaceloTBox data ingestion, rule-based recommendation engine, Africa's Talking SMS alerts) and a Flutter admin dashboard with OpenStreetMap.
- Engineered the SpaceloTBox satellite integration client and implemented secure JWT authentication protocols for the backend infrastructure.
- Designed and deployed comprehensive API documentation utilizing Swagger and OpenAPI specifications to streamline developer onboarding.
- Led the frontend migration to Flutter, establishing the core architecture, routing mechanisms, and initial screen scaffolding.

Experience & Training

Apprentice Developer - Zone01 Kisumu | 2026 - Present

- Practiced peer-to-peer learning and code reviews and engaged in collaborative project development.
- Developed strong foundations in Go, including functions, structs, pointers, algorithms, file handling, testing, and modular application design.
- Built web applications using HTTP servers, HTML/CSS, templates, routing, form handling, and REST-style concepts, including Dockerized applications.
- Strengthened algorithmic thinking through projects such as [Sudoku](#), [Quadchecker](#), [ASCII Art Web](#), and [text-processing applications](#), while using Git and collaborative development workflows.
